

Winfield Greene

As human beings, we need to begin to understand how the world works at a young age. Only one of the 6th graders that I presented my mechanical presentation to had the slightest idea of how cars worked. This is terrible, we use engines every day and yet most of us even after 7 years of attending school, still think of engines as “Fuel in, Mechanical energy out.” School systems need to address this problem by providing science classes that tell us how that skyscraper touches the sky, why the wheels on the bus go round and round, and how the Game Boy they love so much mysteriously displays there favorite character as they control his every move. I also believe that the imaginations develops at a young age, and that jamming 26 letters into a young child’s brain, yet not teaching them that they are free to make there own letter’s, is not the way to go about strengthening an imagination. Also, my philosophy revolves around the fact that we as individuals need to teach ourselves, that is the way that humans learn best, not sit in a group listening to why milk is white. If we literally put ourselves into the knowledge, experience it, we will not only understand it, we will remember it!
